01

Executive Summary

Executive Summary: Overview

The baseline emissions inventory (BEI) is a key instrument that enables local authorities to measure the impact of planned actions relating to emission reductions across their own operations, as well as relevant sectors of society. The BEI represents an evidence-based approach to not only inform appropriate emission reduction actions but also measure progress overtime.

Wicklow County Council's BEI is informed by the guidance document '**Technical Annex C: Climate Mitigation Assessment**', ensuring a robust and consistent approach across all local authorities in the development of their BEIs. As per this guidance document, there are three approaches to the development of a BEI – *Tier 1, Tier 2 and Tier 3* – each of which allow for local authorities at varying levels of experience and maturity to produce a BEI.

Wicklow County Council's have adopted both a **Tier 1** and **Tier 2** approach, as summarised below.

2018 is used as the baseline year for this BEI assessment. This year has been purposefully chosen to align with Ireland's national targets which are set against a 2018 baseline year.

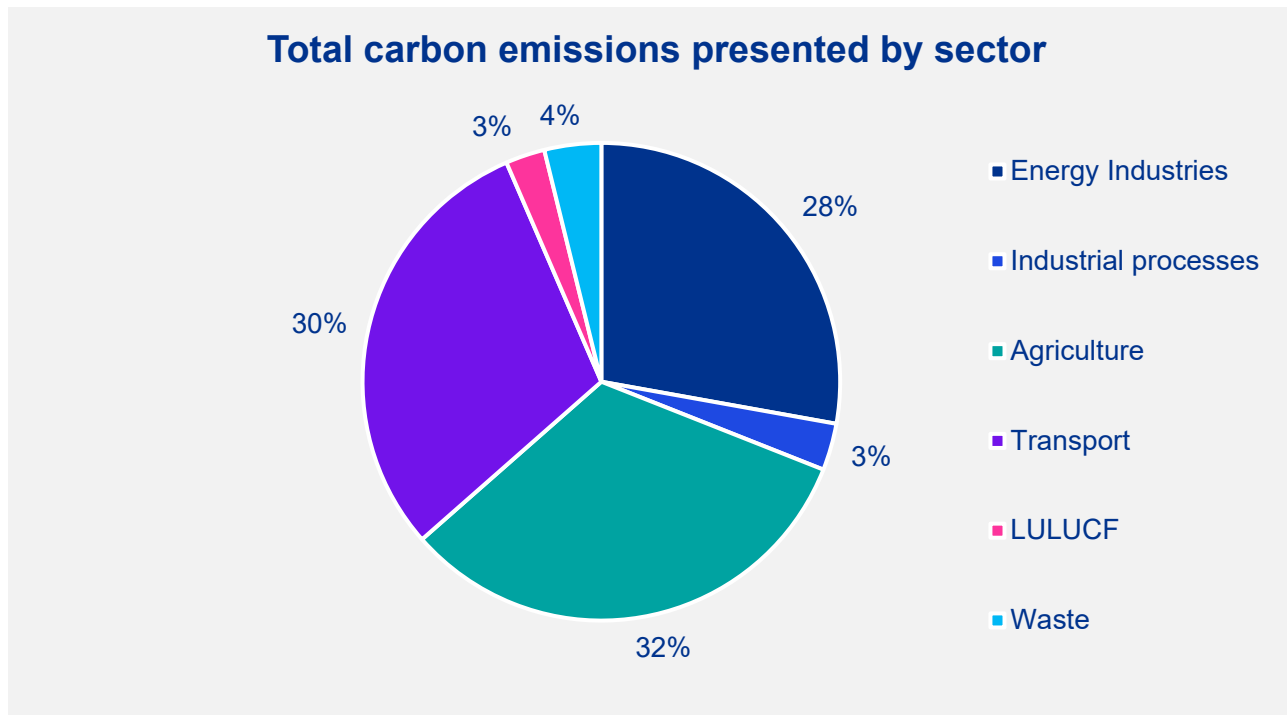

The results of the **Tier 1** and **Tier 2** are summarised on the following pages.

Executive Summary: Tier 1 assessment results

The EPA's MapElre database has been used to inform the Tier 1, 'Top-Down' assessment of carbon emissions within the Wicklow County Council boundary area.

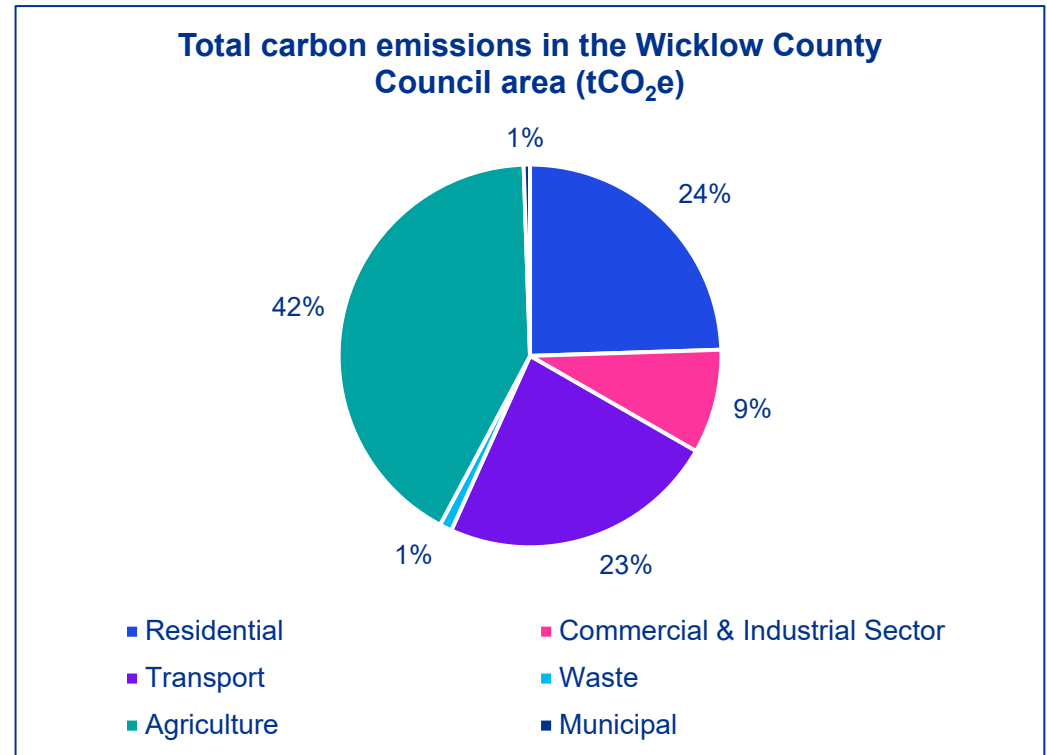

Total baseline carbon emissions across the Wicklow County Council boundary area equates to: **1,101,000 tCO₂e**.

Executive Summary: Tier 2 assessment results

Total carbon emissions equate to approximately **1,275,091 tCO₂e**.

	Carbon emissions (tCO ₂ e)
Residential	312,201
Commercial & Industrial Sector	112,246
Transport	299,115
Waste	13,308
Agriculture	531,399
Municipal	6,822
Total carbon emissions	1,275,091
Total carbon emissions per capita (tCO₂e/capita)	8.95

02

Introduction

1.1 Global & National Response to Climate Change

Global responses to climate change are accelerating as exemplified by the signing of the COP21 Paris Agreement by 195 countries in 2015. Ireland's climate policies are evolving in line with national and international requirements and aims to "pursue and achieve, by no later than the end of 2050, the transition to a climate resilient, biodiversity rich, environmentally sustainable and climate neutral economy."

Climate change has become one of the most pressing global public policy challenges facing governments today.

In response to the challenges posed by climate change, two complementary approaches are being adopted.

International organisations, national and local governments are increasingly compelled to take ambitious action through mitigation (decreasing emissions that cause climate change) and adaptation (enhancing resilience to climate change impacts and risks).

Mitigation: ensuring the impacts of climate change are less severe by preventing or reducing carbon emissions. Mitigation is achieved either by reducing the sources of these gases (e.g. by increasing the share of renewable energies, or establishing a cleaner mobility system), or by enhancing the storage of these gases (e.g. by increasing the size of forests).

Ireland's Local Authorities are developing Local Authority Climate Action Plans (LACAPs) to play their part in meeting national emissions objectives and to transition to a climate resilient, biodiversity rich, environmentally sustainable and climate neutral economy. These plans need to be underpinned by a robust evidence base detailing sources of emissions as well as the current and future climate-related risks faced by the Local Authority.

Adaptation: anticipating the adverse effects of climate change and taking appropriate action to prevent or minimise the damage they can cause, or taking advantage of opportunities that may arise. Examples of adaptation measures include large-scale infrastructure changes, such as building defences to protect against sea-level rise, as well as behavioural shifts, such as individuals reducing their food waste.

1.2 Ireland's Response to Climate Change

Paris Agreement, 2015

The Paris Agreement, adopted in 2015 provides an internationally accepted and legally binding global framework to addressing climate change challenges. It has two clearly defined goals aimed at supporting progressive and ambitious climate action to avoid dangerous climate change:

- I. holding global average temperature increase to well below 2°C and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels (i.e. **mitigation**);
- II. increasing the ability to adapt to the adverse impacts of climate change and foster climate resilience (i.e. **adaptation**).

European Climate Law, 2021

The EU adopted a legislative proposal for the European Climate Law in June 2021 to frame the climate neutrality objective by 2050 across the EU with an intermediate target of **reducing net greenhouse gas emissions by at least 55% by 2030**. The European Commission (EC) is clear in the commitment required by all Member States, and the use of all policy levers and instruments, to fight against the urgent challenge of climate change and to activate leadership efforts to reach climate neutrality by 2050.

Climate Action and Low Carbon Development (Amendment) Act, 2021

Climate policy in Ireland reflects the ambition of the EU and that required to confront the challenges of climate change. The Climate Action and Low Carbon Development (Amendment) Act, 2021 frames Ireland's legally binding climate ambition to delivering a **reduction in greenhouse gas emissions of 51% by 2030**, to achieve climate neutrality by the end of 2050.

Through progressive economy-wide carbon budgets, sectoral ceilings, a suite of strategies devised to promote a **combination of adaptation and mitigation measures**, and robust oversight and reporting arrangements, climate policy is working to scale up efforts across all of society and deliver a step change on ambitious and transformative climate action to 2030 and beyond to 2050.

Climate Action Plan 2023

Regional & Local Policies:

- Regional Spatial and Economic Strategy 2019 – 2031- Eastern and Midlands Regional Assembly
- Wicklow County Development Plan 2022 – 2028

1.3 Establishment of the Baseline Emissions Inventory

The baseline emissions inventory (BEI) is a key instrument that enables local authorities to measure the impact of planned actions related to emission reductions across its own operations as well as relevant sectors of society. The BEI represents an evidence-based approach to not only inform appropriate emission reduction actions but also measure progress overtime.

Wicklow County Council's BEI is informed by the guidance document '**Technical Annex C: Climate Mitigation Assessment**', ensuring a robust and consistent approach across all local authorities to the development of their BEIs. As per this guidance document, there are 3 approaches to the development of a BEI – Tier 1, Tier 2 and Tier 3 – each of which allow for local authorities at varying levels of experience and maturity to produce a BEI. Wicklow County Council's have adopted both **Tier 1** and **Tier 2** approach, as summarised below.

2018 is used as the baseline year for the BEI assessment. This year has been purposefully chosen to align with Ireland's national targets which are set against a 2018 baseline year. This BEI assessment provides a snapshot in time of the carbon emissions across all identified sectors of the economy within the boundaries of a specific local authority. The baseline covers both direct and indirect emission sources within the administrative area, as well as the level of control and influence a local authority has over these emissions.

01

Tier 1 'Top-down' Assessment

- The Tier 1 approach is the simplest and quickest approach to estimate carbon emissions at a County Council level.
- This approach is informed by publicly available data, predominantly the Environmental Protection Agency's (EPA) MapEire database.

02

Tier 2 'Bottom-up' Assessment

- The Tier 2 approach allows for a more detailed look at drivers and hotspots of carbon emissions through use of more detailed datasets .
- This approach is informed predominantly by publicly available data, including the Central Statistics Office (CSO), Transport Omnibus and the Environmental Protection Agency (EPA).

1.4 Characteristics of Wicklow County Council

Wicklow County Council

Geographically the county is dominated by the Wicklow Mountains. It has the largest mountain area and the largest national park in Ireland. Wicklow's unique landscape includes the Sally Gap, Powerscourt, the Bray to Greystones Cliff Walk and the early monastic site of Glendalough, which makes it a popular tourist and recreational user destination.

As of the 2022 Census, County Wicklow has a population of 155,485 people (2016: 142,425), which represents an increase of 13,060 (9.2%) since 2016. The county has experienced relatively steady population growth over recent years and has an almost exactly equal gender breakdown (2016).

CSO data shows that between 1991 and 2011, the largest change in population occurred in the 45 to 64 age group, with an increase of 3% in this age cohort. This will have significant impact on the County's development over the coming years with regard to health care services demand,

dependency and housing with the largest concentration along the N11 corridor coastal zone.

Approximately 36,800 of the County's population live in rural areas (areas outside of the designated county towns and villages), and while the proportion living in rural areas has declined, County Wicklow's rural population has experienced an increase in population between 2006 and 2011.

Wicklow is predominantly an urban county and the council has 5 municipal districts: these include the Municipal Districts of Arklow, Baltinglass, Bray, Greystones and Wicklow. County Wicklow's geographical proximity to County Dublin and its location within the Greater Dublin Area are of key contextual importance in the future development of the County.

Wicklow is predominantly an urban county and the council has 5 municipal districts: these include the Municipal Districts of Arklow, Baltinglass, Bray, Greystones and Wicklow.

County Wicklow's geographical proximity to County Dublin and its location within the Greater Dublin Area are of key contextual importance in the future development of the County.

The principal towns of Arklow, Bray, Wicklow, and Greystones are located on the east coast, with Blessington located on the west, while smaller and more rural settlements are located in the centre and west. The extent of commuting has increased significantly, with increased population growth, particularly in the settlements in the north.

In terms of infrastructure, the main national roads from/to Wicklow are the M11/N11 on the east and the N81 on the west. The county is accessible to and from Dublin by the Dublin to Rosslare railway, Greystones and Bray are serviced by the DART, and Blessington is served by Dublin Bus. The Rosslare Europort provides access to the UK and mainland Europe with over 30 sailings per week.

Tourism and recreation make a positive contribution to the economic and social wellbeing of County Wicklow. In 2017, 275,000 overseas tourists visited the County generating revenue of €73m with a further 319,000 domestic visitors generating an estimated €49m in revenue.

03

BEI Assessment

3.1 Tier 1 'Top-down' Assessment

3.1.1 Tier 1 'Top-Down' Assessment: Results (1/4)

The EPA's MapElre database has been used to inform the Tier 1, 'Top-Down' assessment of carbon emissions within the Wicklow County Council boundary area. The results of the Tier 1 'Top-down' assessment is illustrated on the chart below with carbon emissions reported as carbon dioxide equivalent (CO₂e) – this unit allows for the impact of greenhouse gases (GHG) to be reported as one number. Total baseline carbon emissions across the Wicklow County Council boundary area equates to: **1,101 kilotonnes CO₂e**.

As illustrated, the main sources of emissions within the Wicklow County Council boundary area are agriculture, transport and energy industries, accounting for 32%, 30% and 28% of total carbon emissions, respectively. Waste, Land Use, Land Use Change and Forestry (LULUCF) and Industrial processes account for the remaining 10% of total carbon emissions.

Note that the MapElre database does not include analysis of the residential and commercial and public sector. The majority of emissions associated with Energy Industries are associated with electricity generation rather than consumption of energy.

On the following pages, visual representations of transport and agriculture are shown for the purposes of communication. These visual representations are drawn from the MapElre database.

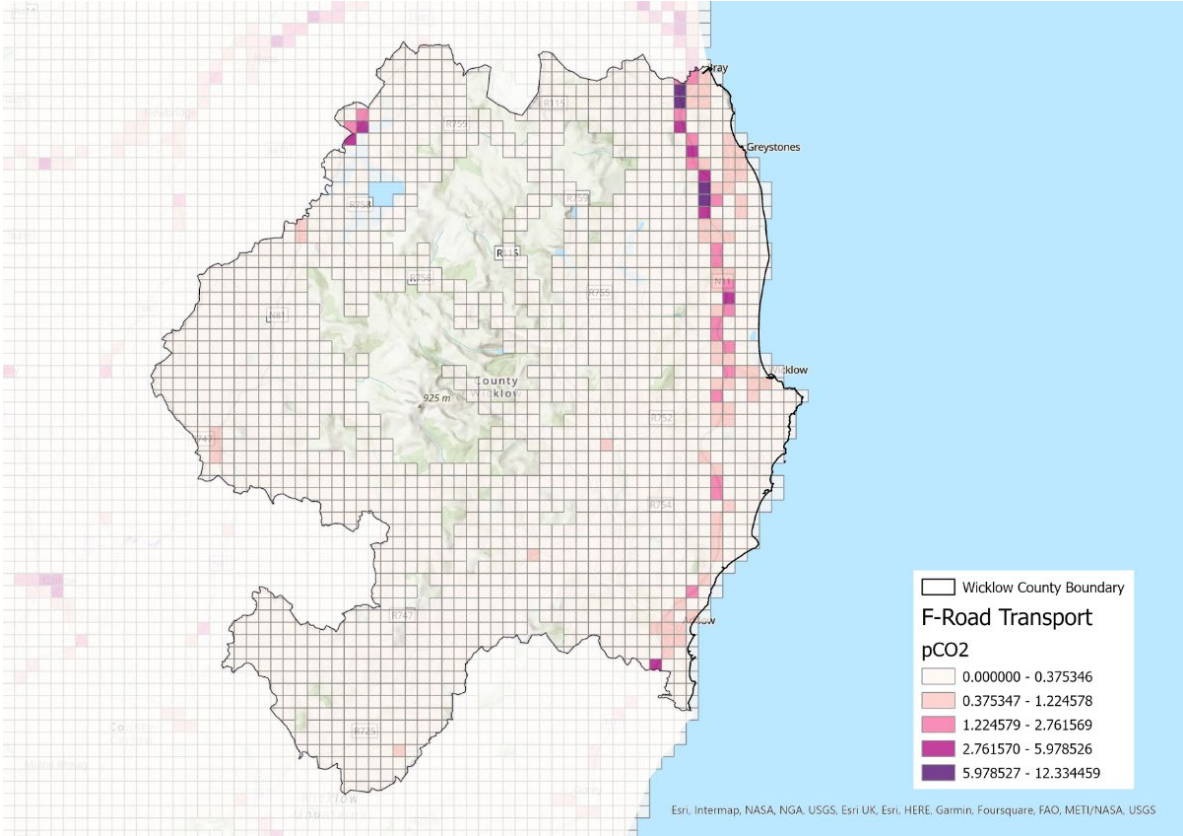

A further breakdown of carbon emissions is included in the **Appendix** of this report.

3.1.2 Tier 1 'Top-Down' Assessment: Results (2/4)

Transport (road)

The map shown here provides a visual representation of the carbon dioxide (CO₂) emissions associated with Road Transport. This includes the burning of diesel and petrol in combustion engines (passenger cars, light duty vehicles, heavy duty vehicles and buses, etc).

Note: the black line boundary reflects Wicklow County Council current administrative boundary.

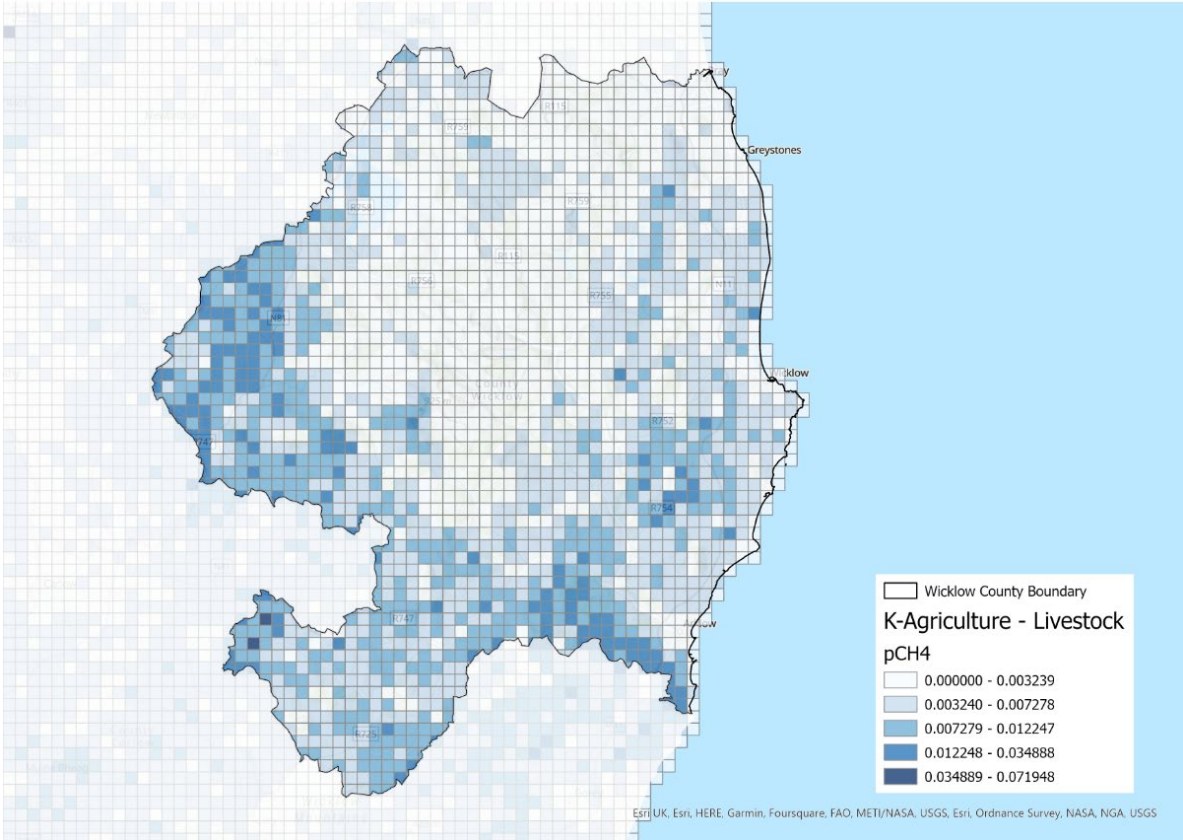

3.1.3 Tier 1 'Top-Down' Assessment: Results (3/4)

Agriculture

The map shown here provides a visual representation of the methane (CH₄) emissions associated with the agriculture sector. These emissions are primarily as a result of livestock farming and associated enteric fermentation.

Note: the black line boundary reflects Wicklow County Council current administrative boundary.

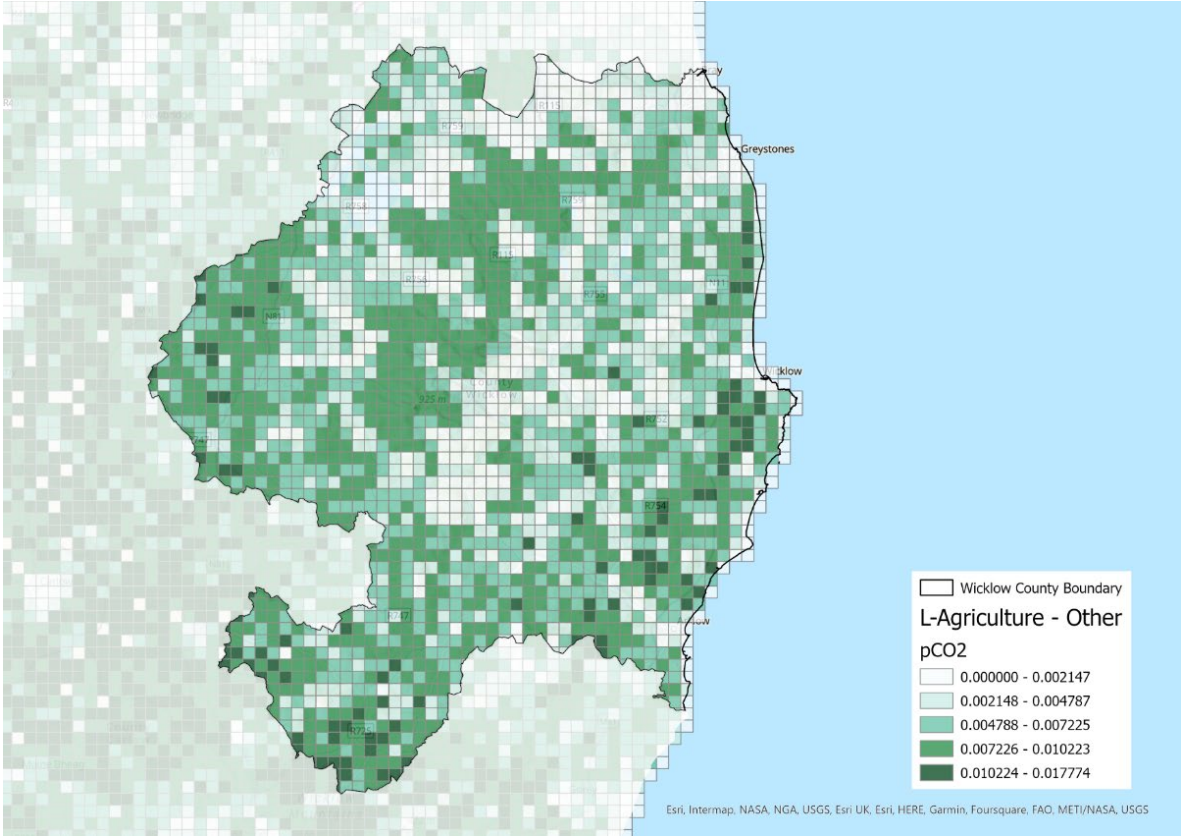

3.1.4 Tier 1 'Top-Down' Assessment: Results (4/4)

Agriculture

The map shown here provides a visual representation of the carbon dioxide (CO₂) emissions associated with the agriculture sector. These emissions are primarily as a result of on farm machinery use and farm buildings.

Note: the black line boundary reflects Wicklow County Council current administrative boundary.

3.2 Tier 2 'Bottom-up' Assessment

3.2.1 Methodology: Tier 2 'Top-Down' Assessment

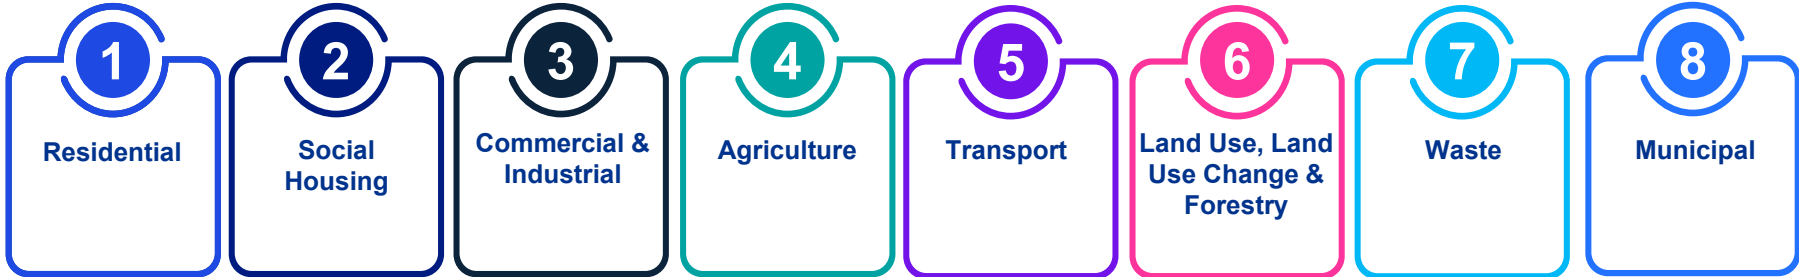

The Tier 2 'Bottom-up' approach allows for a more detailed look at drivers and hotspots of carbon emissions through the use of more detailed datasets. The purpose of this Tier 2 assessment approach is not to override the Tier 1 assessment outcomes, but rather to provide an additional layer of granularity to inform targeted decision making.

The assessment focuses on 8 key sectoral emissions sources, as detailed below. This report is structured around each sector individually, setting out key insights, results and analysis.

The assessment is highly dependant on the data made available by both public sector bodies and also the local authority.

All data sources, assumptions and limitations are set out clearly in this report and the supporting **Appendix**.

Key sectors:

3.2.1.1 Summary Results

The results of the ‘bottom-up’ Tier 2 assessment are presented in the table and chart below.

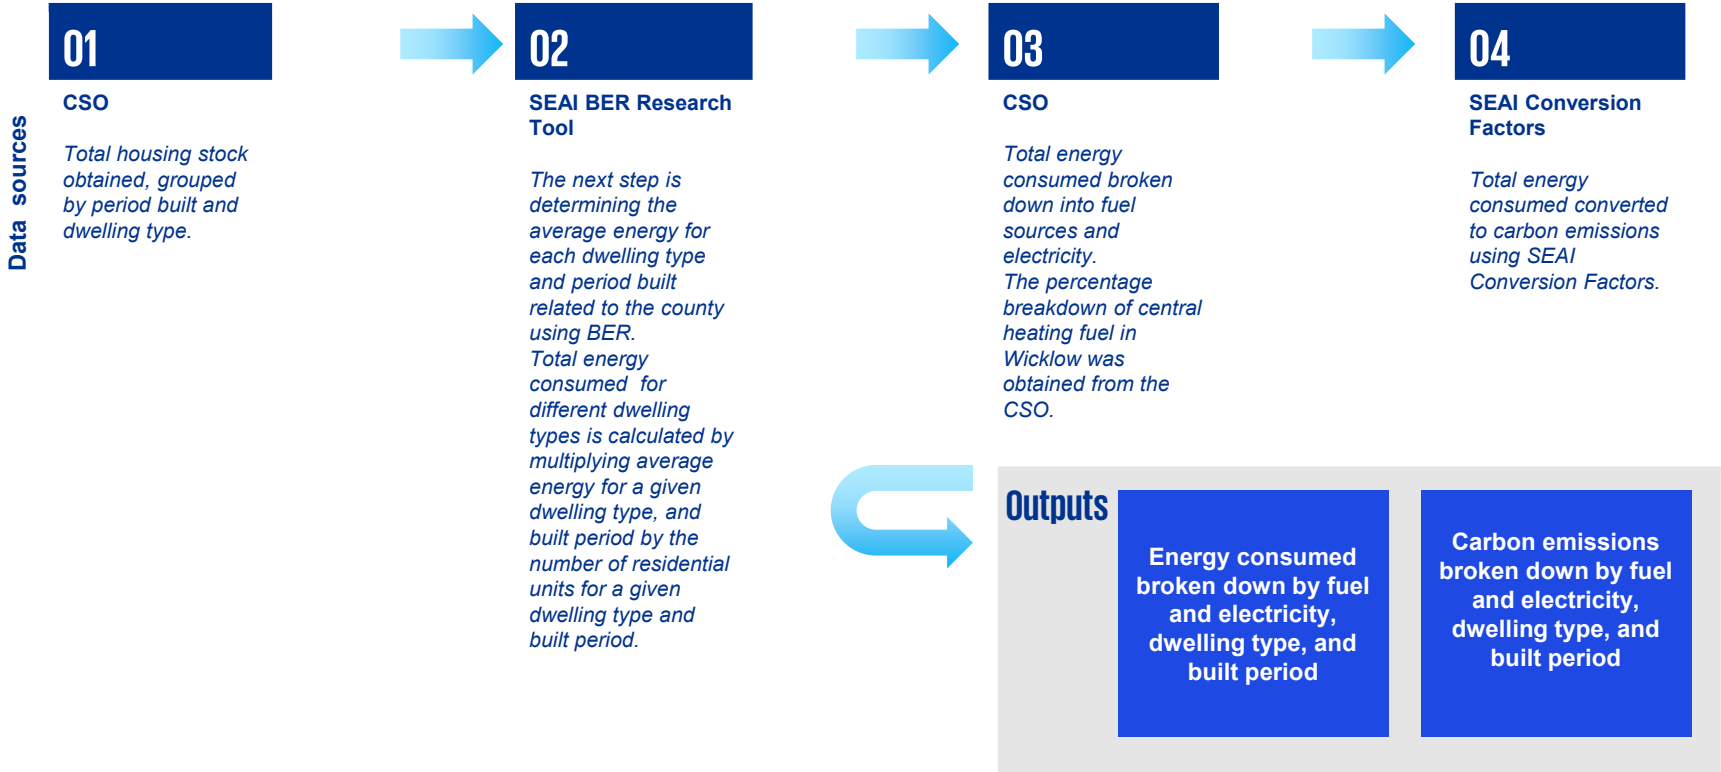

Total carbon emissions equate to approximately **1,275,091 tCO₂e**. This translates to **8.95 tCO₂e per capita** based on 2016 census population data. In 2018, Ireland’s national carbon emissions equated to approximately 12.6 tCO₂e per capita. While Wicklow County’s carbon emissions per capita is lower than the national equivalent, Ireland is significantly higher than the EU average of 8.2 tCO₂e per capita.

	Carbon emissions (tCO ₂ e)
Residential	312,201
Commercial & Industrial Sector	112,246
Transport	299,115
Waste	13,308
Agriculture	531,399
Municipal	6,822
Total carbon emissions	1,275,091
Total carbon emissions per capita (tCO₂e/capita)	8.95

3.2.2 Residential Sector: Approach

The 'bottom-up' approach ('Tier 2') used to calculate energy consumption and carbon emissions associated with the residential sector within the Wicklow County Council boundary has been calculated in four key steps as described below.

3.2.3 Residential Sector: Results (1/2)

Total residential sector related energy consumption, broken down by building type and fuel type is shown below. The associated carbon emissions (tonnes CO₂e) are also shown. The results show that detached houses are the highest energy consuming and carbon emitting residential building type with oil being the highest consumed fuel.

Energy consumption (MWh)									
Residential building type	Coal	Peat	Oil	LPG	Natural Gas	Renewables	Electricity	Wood	Total (MWh)
Detached house	35,970	7,424	339,383	4,855	271,983	7,481	49,353	31,667	748,116
Semi-detached house	14,775	3,050	139,407	1,994	111,721	3,073	20,272	13,008	307,301
Terraced house	7,974	1,646	75,240	1,076	60,297	1,658	10,941	7,020	165,853
Apartment, flat, bedsit	2,474	511	23,344	334	18,708	515	3,395	2,178	51,457
Total MWh	61,194	12,630	577,374	8,259	462,709	12,727	83,961	53,873	1,272,727

The table below shows the central heating energy source split of occupied private households within the Wicklow County Council area (CSO 2016). Oil and Natural Gas are shown as the most commonly used fuel source.

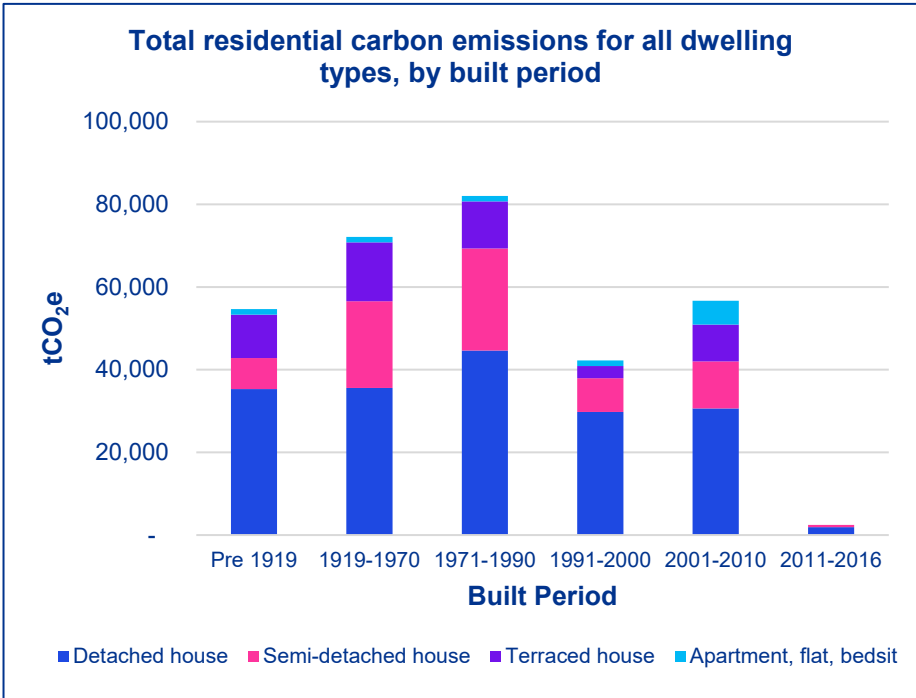

Carbon emissions (tCO ₂ e)									
Residential building type	Coal	Peat	Oil	LPG	Natural Gas	Renewables	Electricity	Wood	Total (tCO ₂ e)
Detached house	12,251	2,642	92,855	1,113	55,675	-	18,517	477	183,531
Semi-detached house	5,032	1,085	38,142	457	22,869	-	7,606	196	75,388
Terraced house	2,716	586	20,586	247	12,343	-	4,105	106	40,688
Apartment, flat, bedsit	843	182	6,387	77	3,829	-	1,274	33	12,624
Total tCO₂e	20,843	4,495	157,969	1,894	94,717	-	31,502	811	312,231

Energy Source	% energy split across Wicklow households
Oil	45%
Natural gas	36%
Electricity	7%
Coal	5%
Peat	1%
LPG	1%
Wood	4%
Renewables	1%
Total	100%

3.2.4 Residential Sector: Results (2/2)

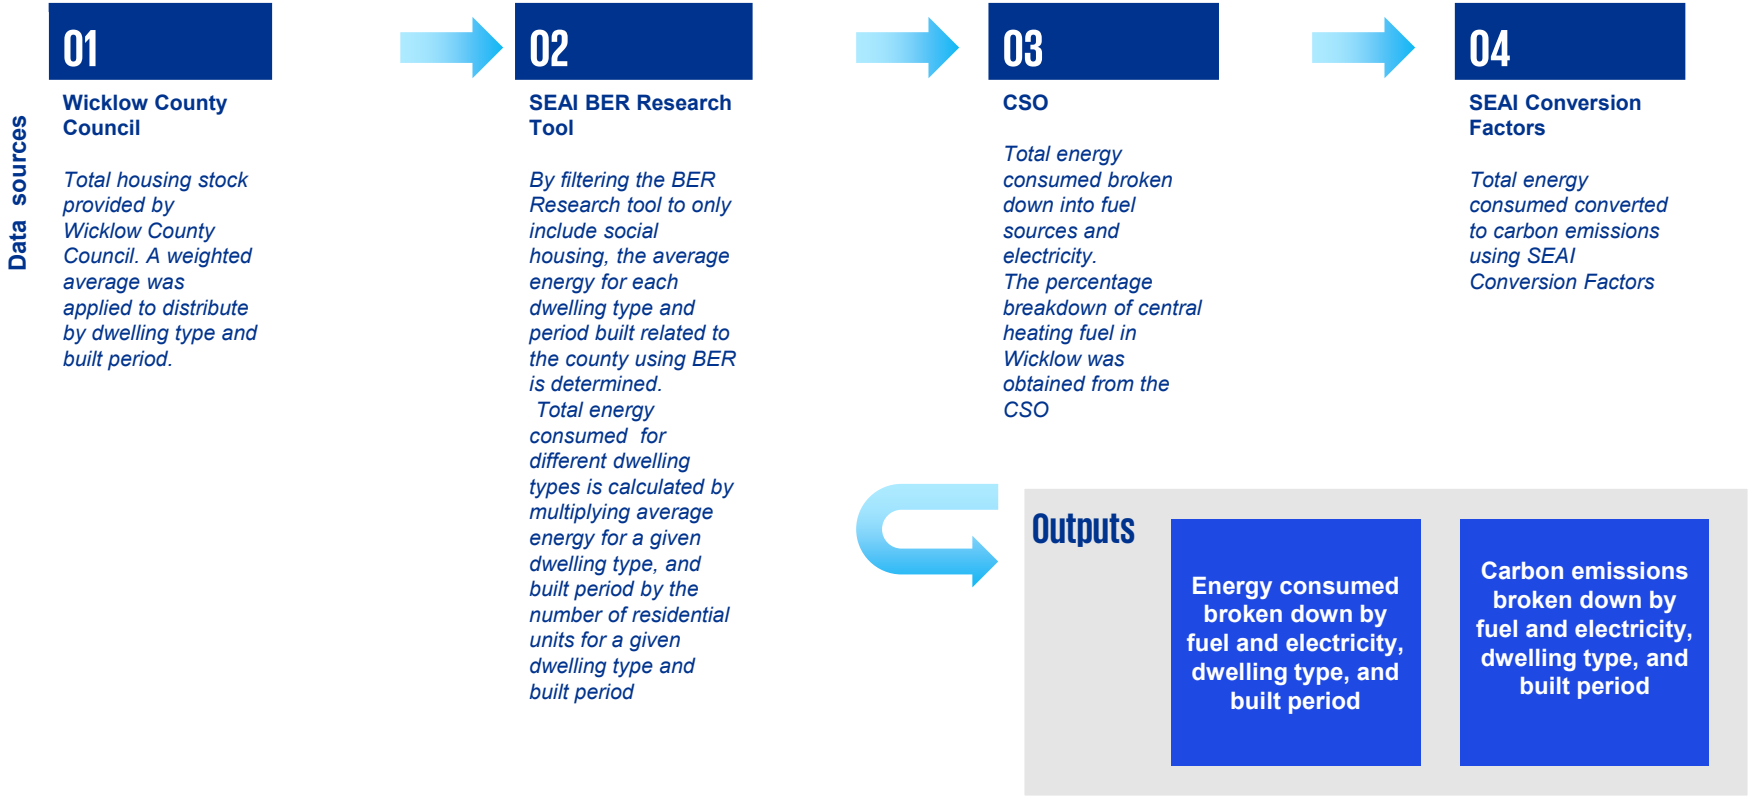

Total residential sector related energy consumption -by building type and building construction period / age- is shown in the charts below. The associated carbon emissions (CO₂e) is also shown.

Buildings built during the '1971-1990' construction period are responsible for the largest proportion of total energy consumed and also total carbon emissions, both at 26.5%. This can be expected as approximately 26.3% of all dwellings were constructed during this period.

3.2.5 Residential Sector: Social Housing: Approach

The 'bottom-up' approach ('Tier 2') used to calculate energy consumption and carbon emissions associated with the residential sector social housing within the Wicklow County Council boundary has been calculated in four key steps as described below.

3.2.6 Residential Sector: Social Housing: Results (1/2)

Total residential sector social housing related energy consumption, broken down by building type and fuel type is shown below. The associated carbon emissions (tCO₂e) are also shown. The results show that detached houses are the highest energy consuming and carbon emitting residential building type with oil being the highest consumed fuel.

Residential building type	Coal	Peat	Oil	LPG	Natural Gas	Renewables	Electricity	Wood	Total (MWh)
Detached house	2,474	510	23,326	335	18,698	514	3,395	2,180	51,433
Semi-detached house	1,082	223	10,198	146	8,175	225	1,484	953	22,487
Terraced house	640	132	6,029	87	4,833	133	877	563	13,294
Apartment, flat, bedsit	306	63	2,885	41	2,312	64	420	270	6,360
Total MWh	4,502	929	42,438	609	34,018	935	6,176	3,966	93,574

Residential building type	Coal	Peat	Oil	LPG	Natural Gas	Renewables	Electricity	Wood	Total (tCO ₂ e)
Detached house	843	182	6,382	77	3,827	-	1,274	33	12,617
Semi-detached house	368	79	2,790	34	1,673	-	557	14	5,516
Terraced house	218	47	1,650	20	989	-	329	8	3,261
Apartment, flat, bedsit	104	22	789	9	473	-	158	4	1,560
Total tCO₂e	1,533	330	11,611	140	6,964	-	2,317	60	22,955

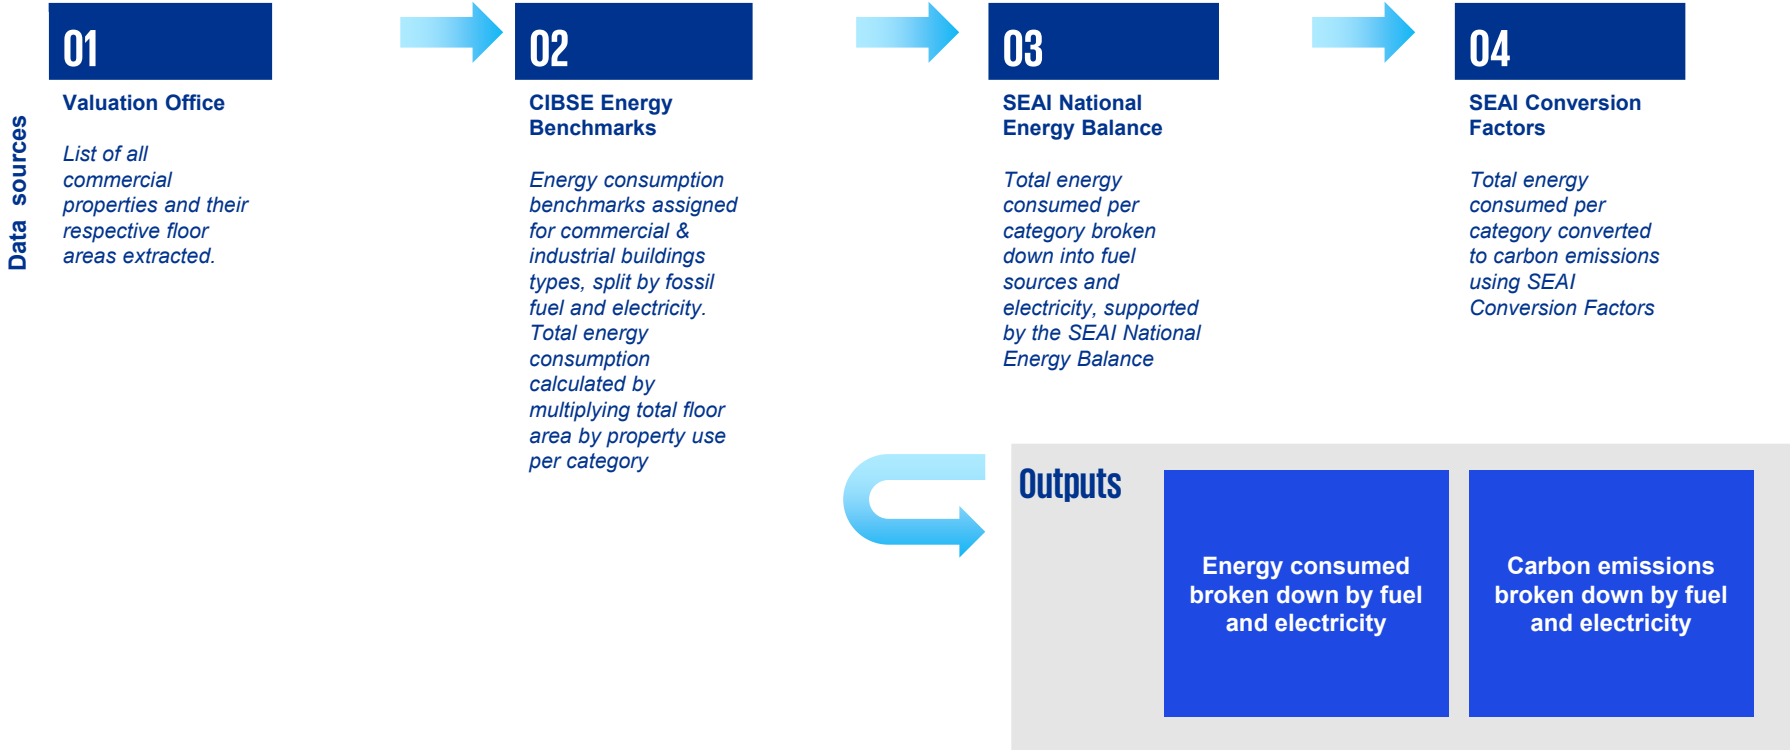

3.2.7 Residential Sector: Social Housing: Results (2/2)

Total residential sector social housing related energy consumption - by building type and building construction period / age is shown in the charts below. The associated carbon emissions (CO₂e) are also shown.

3.2.8 Commercial & Industrial Sector: Approach

The 'bottom-up' approach ('Tier 2') used to calculate energy consumption and carbon emissions associated with the commercial and industrial sector within the Wicklow County Council boundary has been calculated in four key steps as described below.

3.2.9 Commercial & Industrial Sector: Results

Total commercial and industrial sector related energy consumption, broken down by building type, area, fuel and electricity consumption are shown below. Retail buildings occupy the largest floor area of all building types and also account for the highest electricity use. Industrial use buildings occupy one of the smallest floor areas but account for the highest fossil fuel consumption.

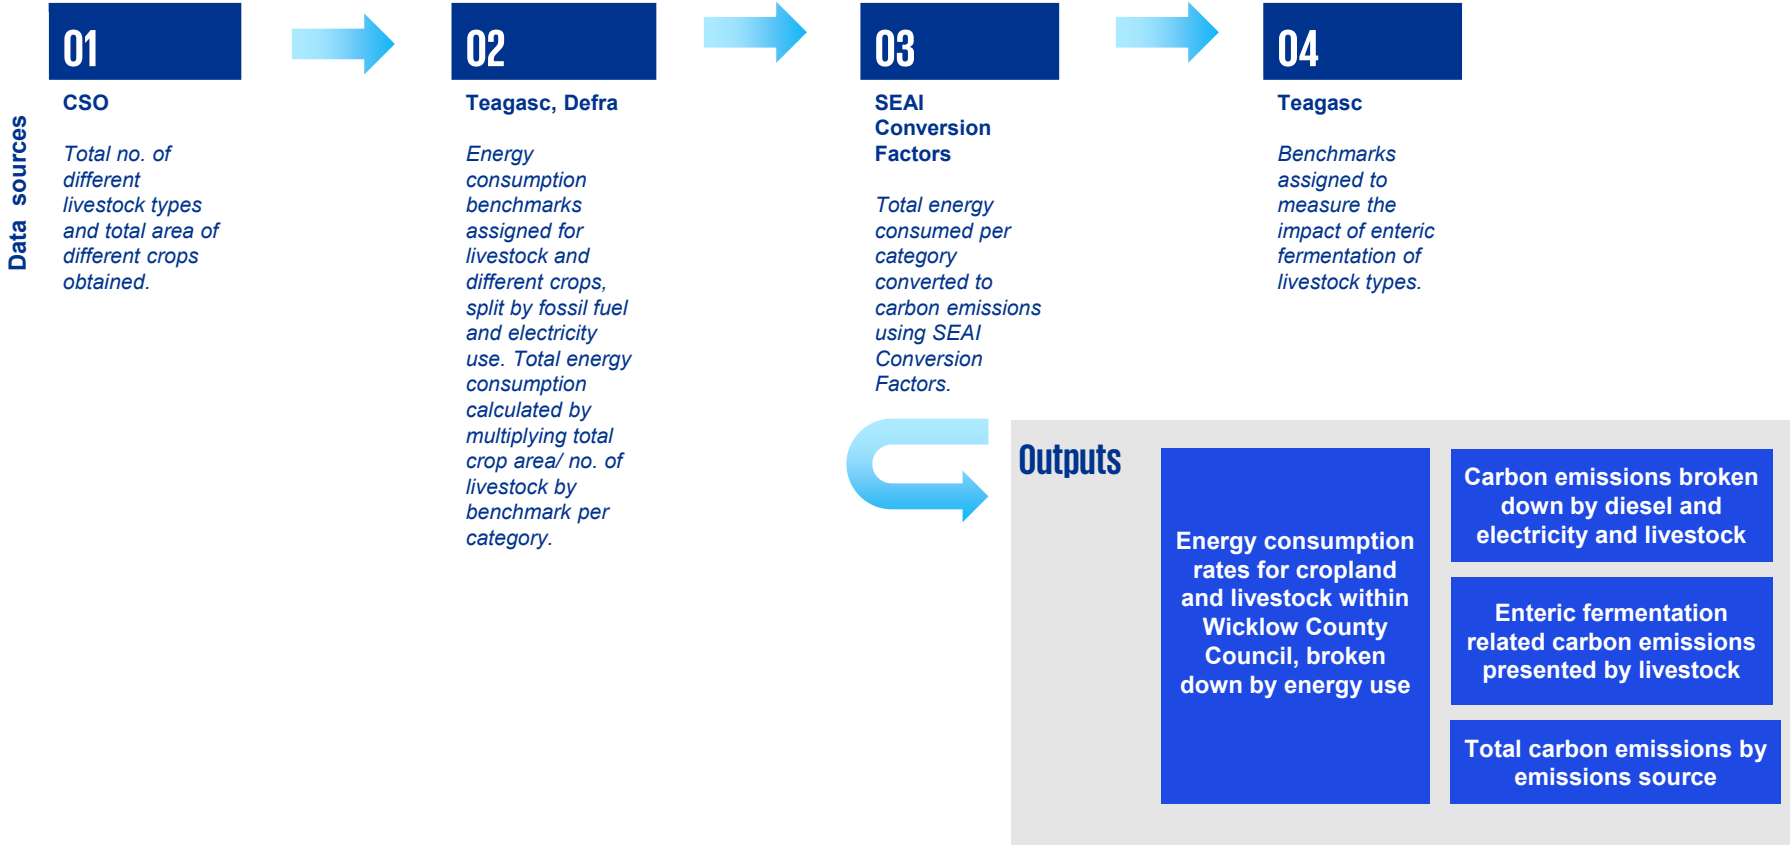

Commercial / Industrial building type	Area (m ²)	Fossil Fuels (MWh)	Electricity (MWh)
Fuel/ Depot	2,217	379	353
Health	13,215	639	179
Hospitality	120,909	79,555	38,578
Industrial Uses	4,501	128,623	-
Leisure	54,601	32,651	8,299
Minerals	4,501	935	808
Office	141,680	21,394	12,043
Retail (Shops)	211,541	35,645	60,642
Retail (Warehouse)	63,447	10,723	4,251
Total	614,396	310,544	125,153

Total commercial and industrial sector related energy consumption, broken down by fuel type and electricity are shown below. Natural Gas is the highest consumed fuel source.

Energy Source	Total energy consumption by energy source (kWh)	Total carbon emissions by energy source (tCO ₂ e)
Coal	265	90
Oil	122,735	30,922
Natural Gas	167,450	34,277
Renewables	20,094	-
Electricity	125,153	46,958
Total	435,698	112,246

3.2.10 Agriculture Sector: Approach

The 'bottom-up' approach ('Tier 2') used to calculate energy consumption and carbon emissions associated with the agriculture sector within the Wicklow County Council boundary has been calculated in four key steps as described below.

3.2.11 Agriculture Sector: Results (1/3)

Cropland: Total cropland energy consumption and related carbon emissions is shown below, based on hectares of land farmed farms in Wicklow County Council area.

Cropland	Hectares (Ha) of cropland farming	Energy requirements (MWh)			Carbon emissions (tCO ₂ e)		
		Electricity	Heating	Mobile Machinery	Electricity	Heating	Mobile Machinery
Total crops, fruit & horticulture	3,236	12,444	2,427	3,721	4,669	624	982
Total cereals	10,727	4,979	1,467	15,888	1,868	377	4,193
Total cropland	13,963	17,423	3,894	19,609	6,537	1,001	5,175
	Total		40,926			12,713	

Livestock fuel combustion: Total on-farm fuel combustion and electricity use, and associated carbon emissions on livestock farms is shown below, based on number of livestock on farms in Wicklow County Council area.

Livestock	No. of Livestock on farms	Energy requirements (MWh)			Carbon emissions (tCO ₂ e)		
		Electricity	Heating	Mobile Machinery	Electricity	Heating	Mobile Machinery
Total cattle	131,382	15,498	-	64,142	5,815	-	16,927
Total sheep	323,367	-	-	6,144	-	-	1,621
Total pigs	15,957	80	319	16	30	82	4
Total poultry	36,944	37	-	-	14	-	-
Total livestock	507,650	15,615	319	70,302	5,859	82	18,553
	Total		86,236			24,493	

3.2.12 Agriculture Sector: Results (2/3)

Sheep, Beef Cattle, & Dairy enteric fermentation: Methane emissions produced by livestock enteric fermentation is one of the main contributors to agriculture's total carbon emissions. As the majority of livestock in the county council area are beef cattle, dairy cows, and sheep (~90% of total livestock), to provide for a meaningful and proportionate assessment, these livestock have been focussed on.

To estimate methane emissions associated with cattle and sheep within the Wicklow County Council area, benchmarks (gCH₄/livestock/day) have been used and are presented in the Appendix. Estimated carbon emissions related to enteric fermentation in beef cattle and dairy cows is presented below.

Livestock	No. of total livestock on farms	Methane Emissions (tCH ₄ /year)	Carbon emissions (tCO ₂ e)*
Dairy Cows	47,687	10,081	281,262
Beef Cattle	83,695	5,744	160,255
Total Sheep	323,367	1,888	52,676
Total	454,749	17,713	494,193

* Note that methane emissions (CH₄) have been converted to carbon dioxide equivalent (CO₂e) using IPCC conversion factors as included in the **Appendix**.

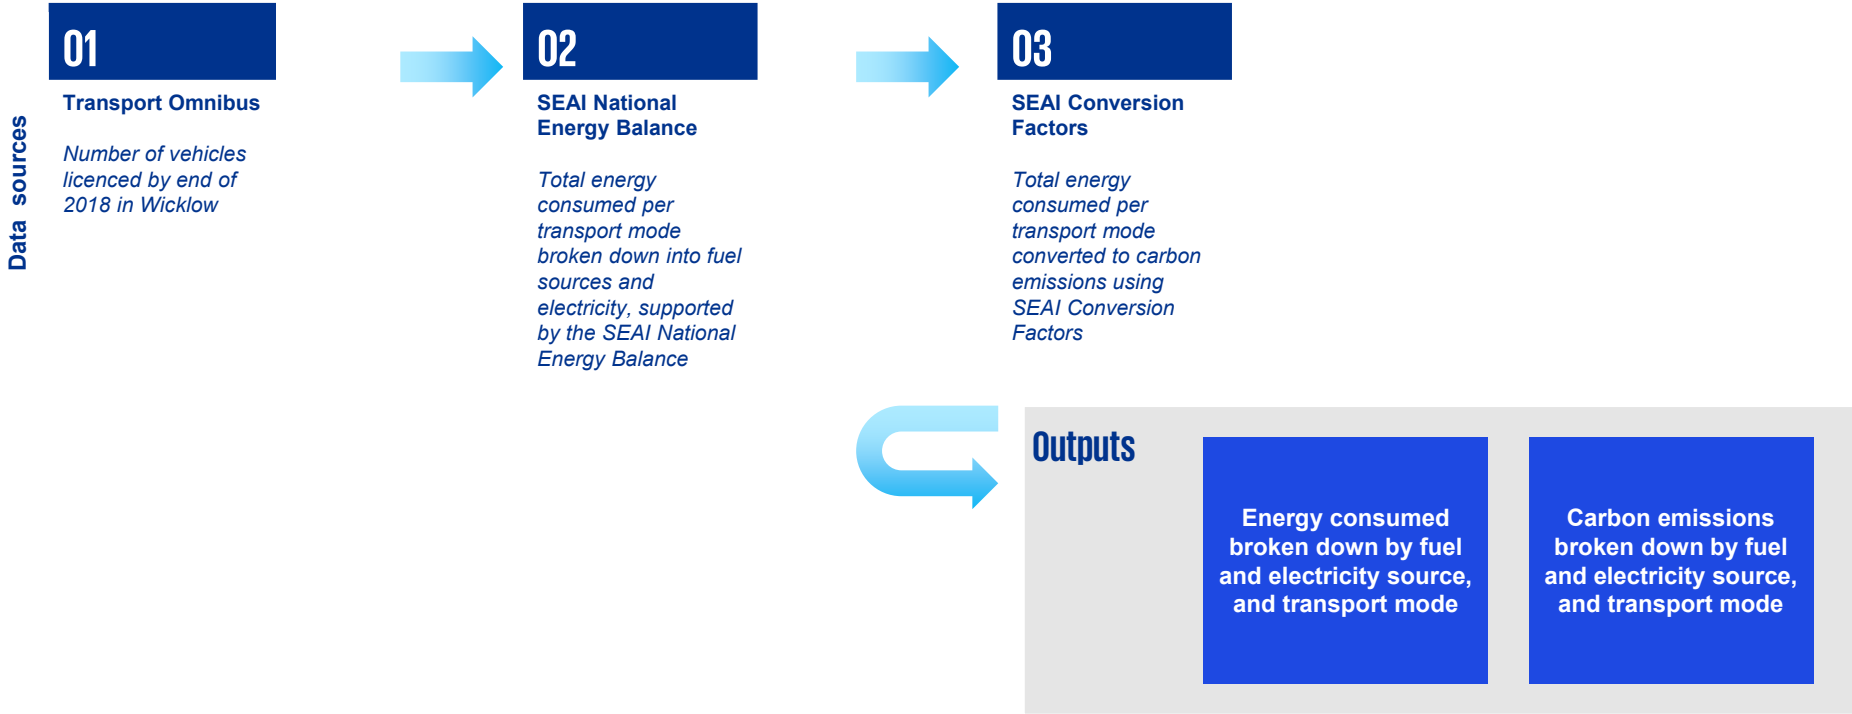

3.2.13 Agriculture Sector: Results (3/3)

Total carbon emissions: Total carbon emissions within the agricultural sector, broken down by source, are shown below. Carbon emissions related to enteric fermentation in sheep, beef cattle and dairy cows account for the majority of emissions related to the sector.

Agricultural sector emissions source	Carbon emissions (tCO ₂ e)
Cropland	12,713
Livestock fuel combustion	24,493
Enteric fermentation	494,193
Total	531,399

3.2.14 Transport Sector: Approach

The 'bottom-up' approach ('Tier 2') used to calculate energy consumption and carbon emissions associated with the transport sector within the Wicklow County Council boundary has been calculated in three key steps as described below.

3.2.15 Transport Sector: Results

Total transport sector related energy consumption and associated carbon emissions, broken down by transport mode, fuel and electricity consumption are shown below. Road Private Cars are the transport mode that accounts for the highest proportion of both total energy consumption and carbon emissions, at approx. ~65.5% of both.

Transport mode	Energy Consumption (MWh)							
	Gasoline	LPG	Gasoil / Diesel /DERV	Natural Gas	Biodiesel	Bioethanol	Electricity	Total
Road Freight	-	-	261,984	11	11,231	-	-	273,215
Road Light Goods Vehicle	-	-	103,104	-	4,420	-	-	107,524
Road Private Car	254,933	700	495,965	-	21,262	8,442	403	781,704
Public Passenger Services	1,374	-	26,546	-	1,138	45	-	29,104
Total	256,307	700	887,599	11	197,751	8,487	403	1,191,557

Transport mode	Carbon emissions (tCO ₂ e)							
	Gasoline	LPG	Gasoil / Diesel /DERV	Natural Gas	Biodiesel	Bioethanol	Electricity	Total
Road Freight	-	-	69,137	2	-	-	-	69,140
Road Light Goods Vehicle	-	-	27,209	-	-	-	-	27,209
Road Private Car	64,218	160	130,885	-	-	-	151	195,414
Public Passenger Services	346	-	7,006	-	-	-	-	7,352
Total	64,564	160	234,237	2	-	-	151	299,115

3.2.16 LULUCF Sector: Approach

The 'bottom-up' approach ('Tier 2') used to explore the LULUCF sector in Wicklow County Council has been based on the Corine dataset.

3.2.17 LULUCF Sector: Results (1/2)

The top land use types (~95%) within the Wicklow County Council boundary area are shown below, alongside the associated hectares and the % of total area each accounts for. A full list is given in the **Appendix**.

Type of Land Use (as per Corine 2018)	Area (hectares (ha))	% of Wicklow County Council area
Pastures	86,768	43%
Coniferous forest	22,177	11%
Moors and heathland	19,128	9%
Peat bogs	18,087	9%
Non-irrigated arable land	11,109	6%
Land principally occupied by agriculture, with significant areas of natural vegetation	10,737	5%
Transitional woodland-shrub	9,593	5%
Mixed forest	6,202	3%
Discontinuous urban fabric	3,958	2%
Broad-leaved forest	3,622	2%
Total	191,381	95%

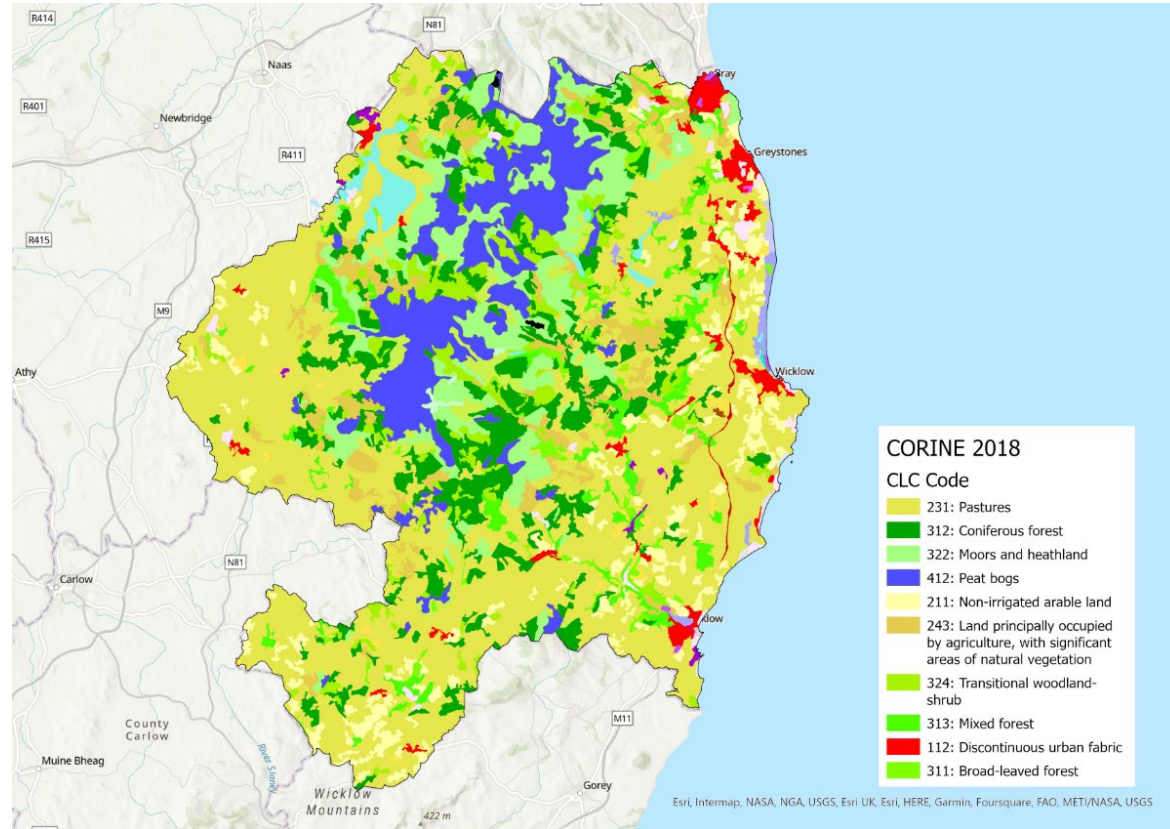

3.2.18 LULUCF Sector: Results (2/2)

LULUCF

Corine database has been utilised to understand land uses within the Wicklow County Council area.

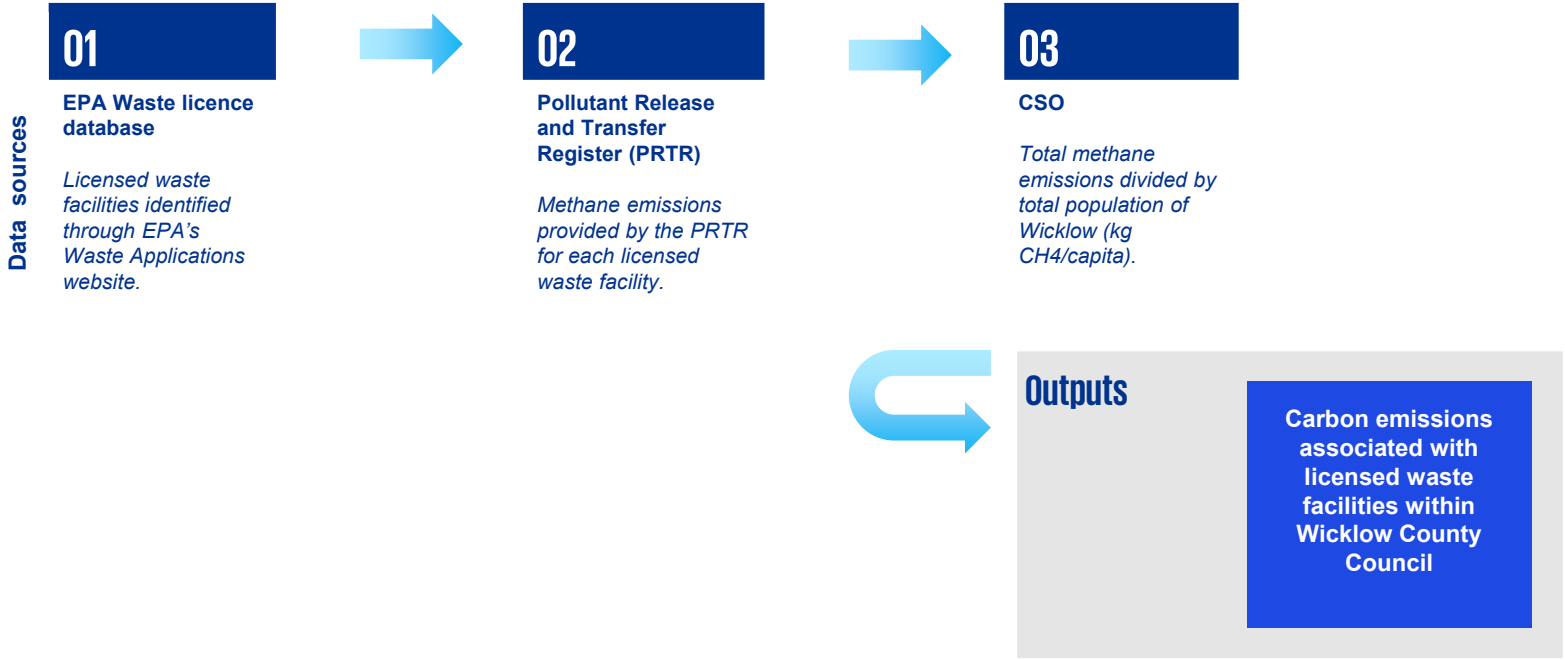

The map shown here provides a visual representation of land use types which cover ~94.5% of the Wicklow County Council area (10 land use types). Note that 'pastures', cover more than 40% of the Wicklow County Council area.

Note: the black line boundary reflects Wicklow County Council current administrative boundary.

3.2.19 Waste Sector: Approach

The 'bottom-up' approach ('Tier 2') used to calculate energy consumption and carbon emissions associated with the waste sector within the Wicklow County Council boundary has been calculated in three key steps as described below.

3.2.20 Waste Sector: Results

Methane emissions associated with identified waste facilities within Wicklow County Council is shown below. Emissions per capita are also provided to allow for further understanding of emissions attributable to the boundary area at a later stage. Note that this does not provide a complete picture of waste facilities and methane emissions within the Wicklow County Council boundary area due to data limitations.

Waste facility name and address	Total methane emissions (kgCH ₄)	Total methane emissions (tCH ₄)
Ballymurtagh Landfill Facility, Ballymurtagh, Ballygahan Upper, Ballygahan Lower, Tinnahinch, Wicklow.	155,866	156
Rampere Landfill, Rampere, Wicklow.	112,886	113
Ballynagran Residual Landfill, Ballynagran, Coolbeg and Kilcandra, Wicklow.	198,577	199
	Total	467

Total tCH ₄ /capita
0.0033

3.2.21 Municipal Sector: Approach

The 'bottom-up' approach ('Tier 2') used to calculate energy consumption and carbon emissions associated with the municipal sector within the Wicklow County Council boundary has been calculated in two key steps as described below.

3.2.22 Municipal Sector: Results

The tables below show the total energy consumption and carbon emissions of the Municipal Sector, grouped by fuel type and sector. Municipal Buildings/ facilities account for the highest energy consumption and carbon emissions.

Sector	Electricity (MWh)	Fossil Fuel (MWh)						Renewable Energies (MWh)				Total (MWh)
		Natural Gas	Liquid Gas	Kerosene	Gasoil	Diesel	Gasoline	Biofuel	Other Biomass	Onsite Generation	Solar Thermal	
Municipal Buildings/ Facilities	9,617	7,851	-	44	494	-	-	-	-	21	-	18,027
Public Lighting	675	-	-	-	-	-	-	-	-	-	-	675
Municipal Fleet	-	-	-	-	-	4,518	78	193	-	-	-	4,789

Sector	Electricity (tCO ₂ e)	Fossil Fuel (tCO ₂ e)						Renewable Energies (tCO ₂ e)				Total (tCO ₂ e)
		Natural Gas	Liquid Gas	Kerosene	Gasoil	Diesel	Gasoline	Biofuel	Other Biomass	Onsite Generation	Solar Thermal	
Municipal Buildings/ Facilities	3,608	1,607	-	11.36	130	-	-	-	-	-	-	5,357
Public Lighting	253	-	-	-	-	-	-	-	-	-	-	253
Municipal Fleet	-	-	-	-	-	1,192	20	-	-	-	-	1,212

Appendices

4.1 Tier 1 'Top-Down' Assessment: Extended Results

Results of the Tier 1 'Top-down' assessment are further illustrated here, broken down by the relevant greenhouse gases (GHG), i.e. carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O). This illustration provides an important breakdown of emissions sources by greenhouse gas, which supports deeper understanding of sectors and their emissions sources as well as supporting decision making on the biggest drivers for change or hotspots of emissions.

Note that each impact of GHGs on climate change and global warming differs by gas. To understand and compare impacts across GHGs, the Global Warming Potential (GWP) is used. This GWP provides a common unit of measure reflecting how much energy the emissions of 1 tonne of a GHG will absorb over a given period of time relative to the emissions of 1 tonne of CO₂. The table below provides an overview of the GWP of CO₂, CH₄ and N₂O, as aligned to the Intergovernmental Panel on Climate Change (IPCC) Sixth Assessment Report (AR6):

GHG	GWP
CO ₂	1
CH ₄	27.9
N ₂ O	273

4.2 Tier 1 'Top-Down' Assessment: Data sources, assumptions & limitations

Emissions source	Data source	Assumptions & Limitation
<p>Carbon emissions associated with the following sectors:</p> <ul style="list-style-type: none"> • Energy Industries, • Industrial processes, • Agriculture, • Transport, • LULUCF, and • Waste sectors 	<p>MapElre database Source: https://projects.au.dk/mapeire</p>	<ul style="list-style-type: none"> • MapElre database has been used to extract emissions within the Wicklow County Council boundary. • MapElre database provides spatial emissions for two years, consistent with 2018 and 2021 national emissions inventory reporting. For Wicklow County Council's BEI, data consistent with 2018 national emissions inventory reporting has been used. • Data extracted from the MapElre database has been assigned to the relevant sectors (Energy Industries, Industrial processes, Agriculture, Transport, LULUCF & Waste). • Note 1: emissions extracted from the MapElre database are consistent with the emissions published within the EPA's national emission inventory • Note 2: The gridding of the national emissions are done in the MapElre system via use of a number of GeoKeys (normalized tables for spatial distributing of emissions). The GeoKeys are prepared separately for the emission sources, sub-sectors or sectors, depending on the availability of detailed spatial data. The sectors listed in your table are aggregation of a number of sources, which are gridded by using different GeoKeys which again are based on different spatial data. • Note 3: The methodology and the GeoKeys, including the data behind the GeoKeys, are described in the documentation report available on the MapElre website: <ul style="list-style-type: none"> • https://projects.au.dk/mapeire/publications • https://projects.au.dk/fileadmin/projects/mapeire/Documents_and_presentations/MapElre_technical_documentation_report.pdf

4.3 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

Residential sector:

Data Source	Assumption & Limitation
<ul style="list-style-type: none"> CSO Source: https://data.cso.ie/ 	<ul style="list-style-type: none"> Data from CSO has been gathered for Number of dwellings within the Wicklow County Council area. The data is reflective of 2016 census year. The households were grouped into four dwelling types. To account for 'not stated households, the four dwelling types were each given a weighted average, and the 'not stated' were then distributed according to these percentages. The dwelling types were also grouped by building regulation periods. The building regulations periods of 2001-2005, 2006-2011, and 2012 onwards were split 2001-2010, and 2011-2016 to reflect CSO data.
<ul style="list-style-type: none"> SEAI BER Research Tool Source: https://ndber.seai.ie/BERResearchTool/ber/search.aspx 	<ul style="list-style-type: none"> The average energy consumption per dwelling type and built period was obtained from the BER Research Tool. A limitation of the tool is that it is not a full representation of the total housing stock in Wicklow as the legalisation to obtain a certificate only came into effect in 2009. For the purpose of this assessment, only 'Existing' and 'Provisional' ratings were selected to determine the average energy consumption per dwelling type and built period. 'Provisional' ratings were excluded from the extracted data.
<ul style="list-style-type: none"> CSO Source: https://data.cso.ie/ 	<ul style="list-style-type: none"> CSO data reflective of 2016 has been used to inform fuel type breakdown within the residential sector. This data is reflective of Wicklow residential sector activities. The number of households with 'other' stated as their primary central fuel type were assumed to source their central heating from renewables. To account for the number of households with 'not stated' and 'no central heating' fuel types, the eight fuel types were given a weighted average, and the 'not stated' and 'no central heating' were then distributed according to these percentages.
<ul style="list-style-type: none"> SEAI Conversion Factors Source: https://www.seai.ie/publications/Energy-in-Ireland-2019-.pdf 	<ul style="list-style-type: none"> The SEAI conversion factors represent the most robust carbon benchmarks for fuel types in Ireland.

4.4 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

Social Housing:

Data Source	Assumption & Limitation
<ul style="list-style-type: none"> • Wicklow County Council Source: 	<ul style="list-style-type: none"> • Data from Wicklow County Council has been gathered for number of social housing units within the Wicklow County Council area. The data extracted is reflective of the years 1899 to 2018. • The dwelling types were grouped by building regulation periods. The building regulations periods of 2001-2005, 2006-2011, and 2012 onwards were split 2001-2010, and 2011-2016 to reflect CSO data. • The data extracted did not state dwelling type. • A large proportion of the housing stock (44%) was stated as being built in the year 1900. This figure was considered inconsistent following a comparison with the number of dwellings built Pre 1919 listed in CSO data and the BER Research tool. • To determine the breakdown of social housing units built per built period and dwelling type, the percentage split of total housing determined during the residential sector was multiplied by the total number of social housing units.
<ul style="list-style-type: none"> • SEAI BER Research Tool Source: https://ndber.seai.ie/BERResearchTool/ber/research.aspx 	<ul style="list-style-type: none"> • The average energy consumption per dwelling type and built period was obtained from the BER Research Tool. Only ratings stated as 'social housing letting' were selected. • A limitation of the tool is that it is not a full representation of the total housing stock in Wicklow as the legalisation to obtain a certificate only came into effect in 2009. • For the purpose of this assessment, only 'Existing' and 'Provisional' ratings were selected to determine the average energy consumption per dwelling type and built period. 'Provisional' ratings were excluded from the extracted data.
<ul style="list-style-type: none"> • CSO Source: https://data.cso.ie/ 	<ul style="list-style-type: none"> • CSO data reflective of 2016 has been used to inform fuel type breakdown within the residential sector. <ul style="list-style-type: none"> • SEAI Conversion Factors Source: https://www.seai.ie/publications/Energy-in-Ireland-2019-.pdf 	<ul style="list-style-type: none"> • The SEAI conversion factors represent the most robust carbon benchmarks for fuel types in Ireland.

4.5 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

Commercial & Industrial sector:

Data Source	Assumption & Limitation
<ul style="list-style-type: none"> Valuation Office Source: https://www.valoff.ie/en/check-property-valuation-online/ 	<ul style="list-style-type: none"> A list of all the commercial properties within the Wicklow County Council area was obtained from the Valuation Office. The VO data is generated manually. The data was filtered for any negative or very small floor area figures.
<ul style="list-style-type: none"> CSO Source: https://www.cso.ie/en/releasesandpublications/ep/p-ndber/non-domesticbuildingenergyratingsquarter32022/ 	<ul style="list-style-type: none"> The VO data did not contain the respective floor areas of the listed properties within the hospitality sector in Wicklow. The total area of the hospitality sector was calculated using by multiplying the CSO average floor area for Restaurants/ Public Houses and Hotels by the number properties listed in the VO data.
<ul style="list-style-type: none"> Chartered Institution of Building Services Engineers (CIBSE) Energy Benchmarking Tool Source: https://www.cibse.org/knowledge-research/knowledge-resources/knowledge-toolbox/energy-benchmarking-tool 	<ul style="list-style-type: none"> CIBSE benchmarks are a UK data source based on energy consumption data gathered in the UK. The benchmarks do not reflect actual energy consumption in the Wicklow area but are considered a good proxy.
<ul style="list-style-type: none"> SEAI National Energy Balance Source: https://www.seai.ie/publications/Previous-Energy-Balances.xlsx 	<ul style="list-style-type: none"> The national energy split reflects energy consumption of the commercial and public sector at a national level. Although not an actual reflection of energy consumption at Wicklow County level, it is a considered to be a good proxy
<ul style="list-style-type: none"> SEAI Conversion Factors Source: https://www.seai.ie/publications/Energy-in-Ireland-2019-.pdf 	<ul style="list-style-type: none"> The SEAI conversion factors represent some of the most robust carbon benchmarks for fuel types in Ireland and would be considered a strong proxy for carbon calculations in the county.

4.6 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

Agriculture:

Data Source	Assumption & Limitation
<ul style="list-style-type: none"> CSO Source: https://data.cso.ie/ 	<ul style="list-style-type: none"> Data from CSO has been gathered for number of farms, total number of livestock, on farms, and total area of cropland.
<ul style="list-style-type: none"> Teagasc, Department for Environment, Food & Rural Affairs (DEFRA) Various sources 	<ul style="list-style-type: none"> Energy consumption benchmarks have been used to understand the energy consumption from electricity, heating and mobile machinery requirements for livestock and cropland farming. Limited data is available on cropland energy usages and consumptions and therefore, the analysis is limited in terms of providing more detail on related carbon emissions. Benchmarks to measure the impact of enteric fermentation have been used.
<ul style="list-style-type: none"> SEAI Conversion Factors Source: https://www.seai.ie/publications/Energy-in-Ireland-2019-.pdf 	<ul style="list-style-type: none"> The SEAI conversion factors represent some of the most robust carbon benchmarks for fuel types in Ireland and would be considered a strong proxy for carbon calculations in the county.

4.7 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

Transport:

Data Source	Assumption & Limitation
<ul style="list-style-type: none"> • Transport Omnibus 2018 Source: https://www.cso.ie/en/releasesandpublications/ep/p-tranom/transportomnibus2018/ 	<ul style="list-style-type: none"> • Transport Omnibus provides the number of vehicles licenced by end of 2018 in Wicklow.
<ul style="list-style-type: none"> • SEAI National Energy Balance Source: https://www.seai.ie/publications/Previous-Energy-Balances.xlsx 	<ul style="list-style-type: none"> • The national energy split reflects energy consumption of the transport sector at a national level. Although not an actual reflection of energy consumption at Wicklow County level, it is a considered to be a good proxy
<ul style="list-style-type: none"> • SEAI Conversion Factors Source: https://www.seai.ie/publications/Energy-in-Ireland-2019-.pdf 	<ul style="list-style-type: none"> • The SEAI conversion factors represent some of the most robust carbon benchmarks for fuel types in Ireland and would be considered a strong proxy for carbon calculations in the county.

4.8 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

LULUCF:

Data Source	Assumption & Limitation
<ul style="list-style-type: none">• Corine database Source: https://gis.epa.ie/GetData/Download	<ul style="list-style-type: none">• The Corine dataset was used to show a visual representation of CO2 by sector.• The Corine dataset does not contain CO2 emissions of every sector.

4.9 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

Waste Sector:

Data Source	Assumption & Limitation
<ul style="list-style-type: none"> EPA Waste licence database Source: https://epawebapp.epa.ie/terminalfour/waste/index.jsp 	<ul style="list-style-type: none"> The EPA lists of all licenced landfill within the county.
<ul style="list-style-type: none"> Pollutant Release & Transfer Register (PRTR) 	<ul style="list-style-type: none"> Each licenced landfill produces an annual report. The annual report contains a Pollutant Release and Transfer Register (PRTR), where its emissions can be found.
<ul style="list-style-type: none"> CSO Source: https://data.cso.ie/ 	<ul style="list-style-type: none"> As landfills may serve populations outside of the county they are located within, the total emissions of the landfill may not represent the county. To account for this, emissions per capita are calculated. The 2016 CSO population was used in this calculation.

4.10 Tier 2 'Bottom-Up' Assessment: Data sources, assumptions & limitations

Municipal Sector:

Data Source	Assumption & Limitation
<ul style="list-style-type: none"> SEAI M&R System Source: https://www.seai.ie/business-and-public-sector/public-sector/monitoring-and-reporting/ 	<ul style="list-style-type: none"> The SEAI M&R System was used to extract the annual electricity and gas consumption of the local authority, where public sector bodies are required to report on their annual energy performance. The system is updated manually and may contain human errors.
<ul style="list-style-type: none"> SEAI Conversion Factors Source: https://www.seai.ie/publications/Energy-in-Ireland-2019-.pdf 	<ul style="list-style-type: none"> The SEAI conversion factors represent some of the most robust carbon benchmarks for fuel types in Ireland and would be considered a strong proxy for carbon calculations in the county.

4.11 Tier 2 'Bottom-Up' Assessment: Residential Sector supporting data

Residential Sector: Energy & Carbon Emissions

Weighted average of CSO data of dwelling types in Wicklow County Council, grouped by dwelling type and construction period.

Dwelling type	Number						
	All years	Before 1919	1919 to 1970	1971 to 1990	1991 to 2000	2001 to 2010	2011 to 2016
